

Shocking data from Israel's largest healthcare organization shows a staggering increase in cardiac arrest diagnoses.

and number of people dying post vaccination.

We now have some new diagnosis data from Israel, which was acquired through a Freedom of Information Act (FOIA) request made by attorney Ori Shabi on May 30th, 2023.

Firstly, we can observe that Cardiac Arrest diagnoses **nearly doubled** from 2020 to 2021 and **more than doubled** from 2021 to 2022. This is an extremely concerning trend as it is showing **acceleration**.

In 2020, there was **1 cardiac arrest per 251,256 population**. In 2021, there was **1 cardiac arrest per 130,890 population**. In 2022, there was **1 cardiac arrest per 58,275 population**.

If this trend continues at approximately 200%, we will see

1 in 29,137 in 2023,

1 in 14,568 in 2024,

1 in 7,284 in 2025, and so on...

Of course, we hope that with fewer people vaccinating now, the trend may reverse.

For clarification, the annual incidence of out-of-hospital cardiac arrest in Israel varies between 20 and 140 per 100,000 people [SOURCE]. It is important to note that there can be significant discrepancies between population data and health insurance data for several reasons, such as insurance data only including individuals with health insurance coverage. Additionally, variations in definitions (e.g., out-of-hospital cardiac arrests vs. hospital cardiac arrests) can contribute to these discrepancies.

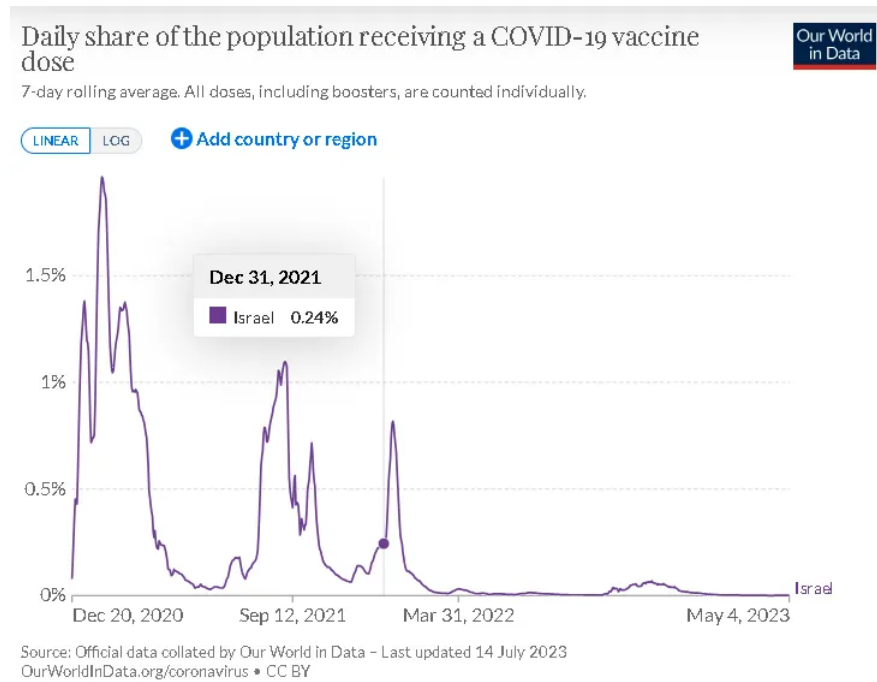

Instead of solely analyzing the numbers, it is more meaningful to examine the trends over time. This approach allows for a better understanding of the patterns and changes in cardiac arrest incidence in Israel.

Let's look at trends on the number of death. The number of deaths due to cardiac arrest and stroke is also increasing at an accelerated rate between 2020 and 2022. Prior to 2020, the number of deaths in these categories was virtually zero.

Vaccinated before event מחוסנים טרום אירוע	Died in hosp. (out of total cases) מהם נפטרו באשפוז	Cases מקרים	Hosp. Type סוג אשפוז	Year שנה
	0	11	Cardiac	2017
	0	20	Cardiac	2018
	0	21	Cardiac	2019
	6	19	Cardiac	2020
27	17	36	Cardiac	2021
67	51	82	Cardiac	2022
	0	1333	Stroke	2017
	1	1503	Stroke	2018
	0	1704	Stroke	2019
5	7	1846	Stroke	2020
1879	49	2499	Stroke	2021
2431	154	3049	Stroke	2022
מחוסנים - לפחות חיסון אחד Vaccinated – at least one vax.				

Israel is one of the most highly vaccinated countries in the world, with 81.5% of its population having received at least one dose.

However, in 2023, it appears that a majority of the population has become anti-vaxxers. It is unfortunate that despite the decrease in experimental vaccinations by the people, deaths and cases continue to accelerate.

My strongest suspicion at the moment is that the cardiac arrests are caused by subclinical myocarditis due to vaccinations instead of COVID infections.

In a large population-based study conducted last year on Clalit Health Services members in Israel, it was found that there was **no increased incidence of either pericarditis or myocarditis in adult patients recovering from COVID-19 infection.** [\[SOURCE\]](#)

The Incidence of Myocarditis and Pericarditis in Post COVID-19 Unvaccinated Patients—A Large Population-Based Study

In another study published in Nature, it was found that there was an increase in emergency cardiovascular events among the under-40 population in Israel during the vaccine rollout and the third wave of COVID-19. [\[SOURCE\]](#)

Delay of Pfizer and Moderna's Subclinical Myocarditis Study

Unfortunately, for reasons unknown, the FDA has not released the data regarding Pfizer's substudy to assess the incidence of subclinical myocarditis after the third dose, which was scheduled for December 2022.

Requirement/Commitment Number: 9

Required Under:	FDAAA Section 505(o)(3)
Original Projected Completion Date:	<u>12/31/2022</u>
Description:	Study C4591031 substudy to prospectively assess the incidence of <u>subclinical myocarditis</u> following administration of a third dose of <u>COMIRNATY</u> in a subset of participants 16 to 30 years of age.
Current Status:	Ongoing

As of June 2023, Moderna's similar study is also overdue, and we have not received any updates from the FDA. If the data were positive, I believe they would have released it promptly. However, it seems that they may need more time to review and "massage" the data before making an announcement.

Thanks for flagging this A17. Still patiently waiting for the tipping point in the population to become suspicious to the cardiac arrests
